- Benefits of Enhancement
- Risks and Limitations
- Conclusion
- Lessons Learned

Introduction

- Introduction
- Proposed Enhancement and Motivation
 Approaches of realizing the new feature
 Impacts on existing subsystems
 Testing Plans
 Effects of Concurrency
 Benefits of Enhancement
 Risks and Limitations
 Conclusion
 Lessons Learned

- Enhancing MySQL to support Range Types
 - allows users to set a range for each column within a table

 Avoids using two columns to define start and end values of a range interval

Introduction

Proposed Enhancement and Motivation
Approaches of realizing the new feature
Impacts on existing subsystems
Testing Plans
Effects of Concurrency
Benefits of Enhancement
Risks and Limitations
Conclusion
Lessons Learned

Ranged Types: A data type that represents a range of values

- Reserving rooms
- Employee scheduling
- Buying something within a certain price range

Introduction
Proposed Enhancement and Motivation
Approaches of realizing the new feature

Oracle Postgres SQL Server IBM DB2 MySQL Feature Data Types A data type that represents a range of values, e.g.: all values from 1 through 100 Range types Yes No No No The dates from 2014-01-01 to 2014-01-08 User defined d No^(*) Yes Yes No Domains (*) (Yes)(*) No Yes No No Dictinct types (*) Voc No No No No

Introduction
Proposed Enhancement and Motivation
Approaches of realizing the new feature
Impacts on existing subsystems
Testing Plans
Effects of Concurrency

Conclusion Lessons Learned

Benefits of Enhancement Risks and Limitations

MySQL Numeric and Date/Time Datatypes (Examples):

	Integer	Fixed-Point	Floating Point	Date and Time
	INT	DECIMAL(5,2)	FLOAT(5,3)	DATETIME
Example	123456	999.99	-999.999	1000-01-01 00:00:00

MySQL Ranged Types (Examples):

Introduction
Proposed Enhancement and Motivation
Approaches of realizing the new feature
Impacts on existing subsystems
Testing Plans
Effects of Concurrency
Benefits of Enhancement
Risks and Limitations

Conclusion Lessons Learned

	Integer	Fixed-Point	Floating Point	Date and Time	
	INTRANGE	DECIMALRANGE(5,2)	FLOAT RANGE (5,3	DATETIMERANGE	
Ex.	[100,200]	(500.01,900.99)	[-123.45,678.91)	[1000-01-01 00:00:00, 2017-11-29,13:00:00)	

() = Does not include (exclusive)

[]= Includes (inclusive)

```
Introduction
Proposed Enhancement and Motivation
Approaches of realizing the new feature

Testing Plans
Effects of Concurrency
Benefits of Enhancement
Risks and Limitations
```

Conclusion Lessons Learned

```
CREATE TABLE work_sched
(
    employeeId INT
    ,during DATETIMERANGE
);
```

```
INSERT INTO work sched
VALUES
  [2017-11-29 09:00:00,
  2017-11-29,17:00:00]
```

Introduction

Proposed Enhancement and Motivation
Approaches of realizing the new feature
Impacts on existing subsystems
Testing Plans
Effects of Concurrency
Benefits of Enhancement
Risks and Limitations
Conclusion

Proposed Enhancement and Motivation

```
SELECT * from work_sched where during =
'[2017-11-29 09:00:00,
2017-11-29,17:00:00]'::DATETIMERANGE
```

```
SELECT * from work sched where during <@
```

```
`[2017-11-29 08:00:00,
2017-11-29,20:00:00]'::DATETIMERANGE
```

Where "<@" means "range is contained by"

Stakeholders

- End-User
- ORACLE
- Competitors (DB2, Amazon RDS)

Introduction

Proposed Enhancement and Motivation
Approaches of realizing the new feature
Impacts on existing subsystems
Testing Plans
Effects of Concurrency
Benefits of Enhancement
Risks and Limitations
Conclusion
Lessons Learned

First Approach: Tuples

$$\{id1 \rightarrow e1, id2 \rightarrow e2, id3 \rightarrow e3, ...\}$$

ei ≜ ith element of range

Id is generated, i.e. user does not provide one

Introduction
Proposed Enhancement and Motivation
Approaches of realizing the new feature
Impacts on existing subsystems

Effects of Concurrency
Benefits of Enhancement
Risks and Limitations
Conclusion
Lessons Learned

Second Approach: Hybrid

Introduction
Proposed Enhancement and Motivation
Approaches of realizing the new feature
Impacts on existing subsystems
Testing Plans
Effects of Concurrency
Benefits of Enhancement
Risks and Limitations
Conclusion
Lessons Learned

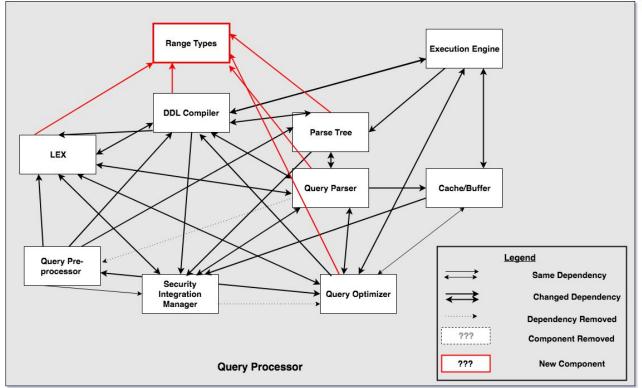

[a, b]
$$\triangleq$$
 { x | a <= x <= b}
OR
{ id1 \mapsto e1, id2 \mapsto e2, id3 \mapsto e3, ... }

Comparing the Approaches

- Approach 1 Tuples
 - + General model
 - + Relatively Simple
 - Large Ranges are an Issue (Scalability)
- Approach 2 Adaptive
 - + Choice
 - Greater Efficiency with Intervals
 - More work on designer's end
- Final Choice : Approach 2

Testing Plans

Effects of Concurrency Benefits of Enhancement Risks and Limitations Conclusion Lessons Learned

Plans for Testing

- Compare the functional and nonfunctional test coverage
 - To account for: performance & resource utilization
 - Utilizing: Random Query Generator

Effects of concurrency

- No effect on concurrency control
- MySQL supports locks of different granularities
 - row locks
 - table locks
- Locks don't deal with individual cells

	Id	User	Host	db	Command	Time	State	Info
•	2	root	localhost:52714	sampledb	Sleep	79		NULL
	3	root	localhost:52715	sampledb	Query	0	starting	show processlist
	4	root	localhost:52779	sampledb	Sleep	99		NULL
	5	root	localhost:52780	sampledb	Query	74	Waiting for table metadata lock	insert into tbl(col) value

Value/Benefits of Enhancement

Introduction
Proposed Enhancement and Motivation
Approaches of realizing the new feature
Impacts on existing subsystems
Testing Plans

Effects of Concurrency
Benefits of Enhancement

Benefits of Enhancement

Risks and Limitations

Conclusion Lessons Learned

- Ranges are everywhere.
- Many use cases that require ranges of values including price, scheduling and measurement data.
- Implementing a range type reduces complexity of range value querying
- Makes searching for overlapping data within a range much easier for the programmer
- select '[2014/01/01, 2014/01/31]'::datetimerange;

Value/Benefits of Enhancement Example

Conclusion Lessons Learned

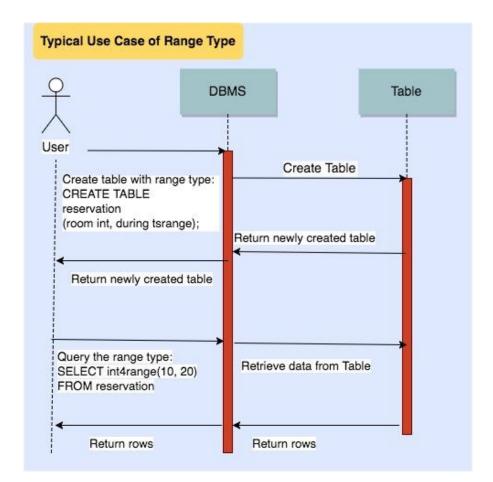

Shopping for a Used Car within a Min/Max budget

```
SELECT *
FROM cars
WHERE
    cars.min price ≤ 13000 AND
    cars.min price ≤ 15000 AND
    cars.max price ≥ 13000 AND
   cars.max price ≤ 15000
  ) OR
    cars.min price ≤ 13000 AND
    cars.min price ≤ 15000 AND
    cars.max price ≥ 13000 AND
    cars.max price ≥ 15000
  ) OR
    cars.min price ≥ 13000 AND
    cars.min price ≤ 15000 AND
    cars.max price ≥ 13000 AND
    cars.max price ≤ 15000
  ) OR
    cars.min price ≥ 13000 AND
    cars.min price ≤ 15000 AND
    cars.max price ≥ 13000 AND
    cars.max price ≥ 15000
ORDER BY cars.min price;
```

```
SELECT *
FROM cars
WHERE cars.price_range && int4range(13000, 15000, '[]')
ORDER BY lower(cars.price range);
```

Use Cases

Introduction

Proposed Enhancement and Motivation Approaches of realizing the new feature Impacts on existing subsystems

Testing Plans

Effects of Concurrency

Benefits of Enhancement

Risks and Limitations

Conclusion Lessons Learned

Risks and Limitations

Introduction
Proposed Enhancement and Motivation
Approaches of realizing the new feature
Impacts on existing subsystems
Testing Plans
Effects of Concurrency
Benefits of Enhancement

Risks and Limitations

Conclusion Lessons Learned

- Since a new subsystem is added there might be
 - some unexpected conflicts and overlapping with existing subsystems
- Only limited to Numeric and DateTime data types
 - With others not so optimal

Conclusions

Introduction
Proposed Enhancement and Motivation
Approaches of realizing the new feature
Impacts on existing subsystems
Testing Plans
Effects of Concurrency
Benefits of Enhancement
Risks and Limitations

Conclusion

Lessons Learned

- Mysql with range types makes it easy to use.
- Doable with the given second approach.
- Doesn't affect concurrency.
- Minimal changes to other subsystems.

Lessons Learned

Normal MySQL

MySQL + Range Types
